

Developing a Seed Mix Formula

$40\text{-}60 \text{ seeds}^*/\text{ft}^2 \times \text{ft}^2 \text{ of garden space} \times 2 \text{ (hand sown)} \times 2 \text{ (not pure live seed}^{**}) = \text{total number of seeds needed for the garden}$

(Example: $40 \times 500\text{sf} \times 2 \times 2 = 80,000 \text{ seeds}$)

* 30 seeds/ft² on successfully established sites

** Rough-cleaned & wild-collected seed

A good website to find seeds per oz.
